System and Method for Concurrent Security Connections

ABSTRACT

method for and concurrent security connections is presented. An association table is used that includes a list of active credentials. An active credential includes information such as user id and password information for a given domain. The active credential may also include dynamic data that is retrieved from a user, such as a pseudo-random code or a fingerprint The active credential is sent to a domain, or the managing server of the domain, when domain access is This access request does not involve the user requested. of the client unless dynamic input data is requested.
